the last ten years have seen a number of significant advances in hopf algebras the best known is the introduction of quantum groups which are hopf algebras that arose in mathematical physics and now have connections to many areas of mathematics in addition several conjectures of kaplansky have been solved the most striking of which is a kind of lagrange s theorem for hopf algebras work on actions of hopf algebras has unified earlier results on group actions actions of lie algebras and graded algebras this book brings together many of these recent developments from the viewpoint of the algebraic structure of hopf algebras and their actions and coactions quantum groups are treated as an important example rather than as an end in themselves the two introductory chapters review definitions and basic facts otherwise most of the material has not previously appeared in book form providing an accessible introduction to hopf algebras this book would make an excellent graduate textbook for a course in hopf algebras or an introduction to quantum groups

in the 19 years which passed since the first edition was published several important developments have taken place in the theory of surfaces the most sensational one concerns the differentiable structure of surfaces twenty years ago very little was known about differentiable structures on 4 manifolds but in the meantime donaldson on the one hand and seiberg and witten on the other hand have found inspired by gauge theory totally new invariants strikingly together with the theory explained in this book these invariants yield a wealth of new results about the differentiable structure of algebraic surfaces other developments include the systematic use of nef divisors in accordance with the progress made in the classification of higher dimensional algebraic varieties a better understanding of kahler structures on surfaces and reider s new approach to adjoint mappings all these developments have been incorporated in the present edition though the donaldson and seiberg witten theory only by way of examples of course we use the opportunity to correct some minor mistakes which we either have discovered ourselves or which were communicated to us by careful readers to whom we are

geometry in ancient greece is said to have originated in the curiosity of mathematicians about the shapes of crystals with that curiosity culminating in the classification of regular convex polyhedra addressed in the final volume of euclid s elements since then geometry has taken its own path and the study of crystals has not been a central theme in mathematics with the exception of kepler s work on snowflakes only in the nineteenth century did mathematics begin to play a role in crystallography as group theory came to be applied to the morphology of crystals this monograph follows the greek tradition in seeking beautiful shapes such as regular convex polyhedra the primary aim is to convey to the reader how algebraic topology is effectively used to explore the rich world of crystal structures graph theory homology theory and the theory of covering maps are employed to introduce the notion of the topological crystal which retains in the abstract all the information on the connectivity of atoms in the crystal for that reason the title topological crystallography has been chosen topological crystals can be described as living in the logical world not in space leading to the question of how to place or realize them canonically in space proposed here is the notion of standard realizations of topological crystals in space including as typical examples the crystal structures of diamond and lonsdaleite a mathematical view of the standard realizations is also provided by relating them to

asymptotic behaviors of random walks and harmonic maps furthermore it can be seen that a discrete analogue of algebraic geometry is linked to the standard realizations applications of the discussions in this volume include not only a systematic enumeration of crystal structures an area of considerable scientific interest for many years but also the architectural design of lightweight rigid structures the reader therefore can see the agreement of theory and practice
