water is becoming an increasingly scarce commodity in many parts of the world
 population growth plus a growing appetite for larger quantities of cheap water
 quality as a result of urban industrial and agricultural pollution coupled with
 increasing environmental demands have further reduced usable suppliers this
 book brings together thirty of the best economic articles addressing water scarcity
 issues within the us and mexico by touching on a number of different issues this
 volume clearly articulates the need for improving existing institutional
 arrangements as well as for developing new arrangements to address growing
 water scarcity problems

in this book award winning author goro shimura treats new areas and presents
 relevant expository material in a clear and readable style topics include witt s
 theorem and the hasse principle on quadratic forms algebraic theory of clifford

algebras spin groups and spin representations he also includes some basic results not readily found elsewhere the two principle themes are 1 quadratic diophantine equations 2 euler products and eisenstein series on orthogonal groups and clifford groups the starting point of the first theme is the result of gauss that the number of primitive representations of an integer as the sum of three squares is essentially the class number of primitive binary quadratic forms presented are a generalization of this fact for arbitrary quadratic forms over algebraic number fields and various applications for the second theme the author proves the existence of the meromorphic continuation of a euler product associated with a hecke eigenform on a clifford or an orthogonal group the same is done for an eisenstein series on such a group beyond familiarity with algebraic number theory the book is mostly self contained several standard facts are stated with references for detailed proofs goro shimura won the 1996 steele prize for lifetime achievement for his important and extensive work on arithmetical geometry and automorphic forms

this volume which is dedicated to heinz langer includes biographical material and carefully selected papers heinz langer has made fundamental contributions to operator theory in particular he has studied the domains of operator pencils and nonlinear eigenvalue problems the theory of indefinite inner product spaces operator theory in pontryagin and krein spaces and applications to mathematical physics his works include studies on and applications of schur analysis in the indefinite setting where the factorization theorems put forward by krein and langer for generalized schur functions and by dijksma langer luger shondin play a key role the contributions in this volume reflect heinz langer s chief research interests and will appeal to a broad readership whose work involves operator theory

this classic textbook provides a unified treatment of spectral approximation for closed or bounded operators as well as for matrices despite significant changes and advances in the field since it was first published in 1983 the book continues to

form the theoretical bedrock for any computational approach to spectral theory over matrices or linear operators this coverage of classical results is not readily available elsewhere the text offers in depth coverage of properties of various types of operator convergence the spectral approximation of non self adjoint operators a generalization of classical perturbation theory and computable errors bounds and iterative refinement techniques along with many exercises with solutions making it a valuable textbook for graduate students and reference manual for self study
