this open access book provides a comprehensive treatment of recent developments in kernel based identification that are of interest to anyone engaged in learning dynamic systems from data the reader is led step by step into understanding of a novel paradigm that leverages the power of machine learning without losing sight of the system theoretical principles of black box identification the authors reformulation of the identification problem in the light of regularization theory not only offers new insight on classical questions but paves the way to new and powerful algorithms for a variety of linear and nonlinear problems regression methods such as regularization networks and support vector machines are the basis of techniques that extend the function estimation problem to the estimation of dynamic models many examples also from real world applications illustrate the comparative advantages of the new nonparametric approach with respect to classic parametric prediction error methods the challenges it addresses lie at the intersection of

several disciplines so regularized system identification will be of interest to a variety of researchers and practitioners in the areas of control systems machine learning statistics and data science this is an open access book

both global food and energy systems are increasingly faced with major challenges regarding food security and non fossil energy provision respectively organic or low input agriculture as well as bioenergy production may contribute to securing rising food and energy needs however low input agricultural systems are challenged for their lower productivity compared to high input systems moreover bioenergy systems are often criticized for their unsustainable high input cropping systems consequently innovative approaches are needed to optimize both sectors a promising strategy may be the integration of organic or low input agricultural systems with agricultural bioenergy production with the objective to increase both productivity and sustainability of land use systems this dissertation examines the opportunities and risks of integrated bioenergy production in organic and low input agricultural systems based on the example of two bioenergy technologies anaerobic digestion and integrated generation of solid fuel and biogas from biomass ifbb by assessment of their structural framework conditions systematic implications as well as economic and risk performance in a final step the role of integrated agricultural bioenergy production within the context of the so called sustainable intensification is debated
