this exposition is devoted to a consistent treatment of quantization problems based on appealing to some nontrivial items of functional analysis concerning the theory of linear operators in hilbert spaces the authors begin by considering quantization problems in general emphasizing the nontriviality of consistent operator construction by presenting paradoxes to the naive treatment it then builds the necessary mathematical background following it by the theory of self adjoint extensions by considering several problems such as the one dimensional calogero problem the aharonov bohm problem the problem of delta like potentials and relativistic coulomb problem it then shows how quantization problems associated with correct definition of observables can be treated consistently for comparatively simple quantum mechanical systems in the end related problems in quantum field theory are briefly introduced this well organized text is most suitable for students and post graduates interested in deepening their understanding of mathematical problems in quantum mechanics however scientists in mathematical and theoretical physics and mathematicians will also find it useful

since the discovery of neutrino oscillations neutrino physics has become an interesting field of research in physics they imply that neutrino must have a small mass and that the neutrinos coupled to the charged leptons are mixtures of the mass eigenstates analogous to the flavor mixing of the quarks the mixing angles for the quarks are small but for the leptons two of the mixing angles are large the masses of the three neutrinos must be very small less than 1 ev but from the oscillation experiments we only know the mass differences the absolute masses are still unknown also we do not know if the masses of the neutrinos

are dirac masses as the masses of the charged leptons and of the quarks or whether they are majorana masses in this volume an overview of the present state of research in neutrino physics is given by well known experimentalists and theorists the contents originated from talks and discussions at a recent conference addressing some of the most pressing open questions in neutrino physics range from the oscillation experiments to cp violation for leptons to texture zero mass matrices and to the role of neutrinos in astrophysics and cosmology

this book presents and analyzes all atmospheric effects of importance for today s satellite systems and discusses the tools needed for designing the links and evaluating system performance it serves as an excellent reference for communications engineers wireless network and system engineers system designers and graduate students in satellite communications and related fields jacket
