award is to formally acknowledge excellence in research we would like to congratulate the
authors of these two papers

who could have predicted that the séminaire de probabilités would reach the age of 40 this
long life is first due to the vitality of the french probabilistic school for which the séminaire
remains one of the most specific media of exchange another factor is the amount of
enthusiasm energy and time invested year after year by the rédacteurs michel ledoux
dedicated himself to this task up to volume xxxviii and marcyormade his name inseparable
from the séminaire by devoting himself to it during a quarter of a century browsing among the
past volumes can only give a faint glimpse of how much is owed to them keeping up with the
standard they have set is a challenge to the new rédaction in a changing world where the
status of paper and ink is questioned and where alas pressure for publishing is increasing in
particular among young mathematicians we shall try and keep the same direction although
most contributions are anonymously refereed the séminaire is not a mathematical journal our
first criterion is not mathematical depth but usefulness to the french and international
probabilistic community we do not insist that everything published in these volumes should
have reached its final form or be original and acceptance rejection may not be decided on

nonlinear analysis of structures presents a complete evaluation of the nonlinear static and dynamic behavior of beams rods plates trusses frames mechanisms stiffened structures sandwich plates and shells these elements are important components in a wide variety of structures and vehicles such as spacecraft and missiles underwater vessels and structures and modern housing today's engineers and designers must understand these elements and their behavior when they are subjected to various types of loads coverage includes the various types of nonlinearities stress strain relations and the development of nonlinear governing equations derived from nonlinear elastic theory this complete guide includes both mathematical treatment and real world applications with a wealth of problems and examples to support the text special topics include a useful and informative chapter on nonlinear analysis of composite structures and another on recent developments in symbolic computation designed for both self study and classroom instruction nonlinear analysis of structures is also an authoritative reference for practicing engineers and scientists one of the world's leaders in the study of nonlinear structural analysis professor sathyamoorthy has made significant research contributions to the field of nonlinear mechanics for twenty seven years his foremost contribution to date has been the development of a unique transverse shear deformation theory for plates undergoing large amplitude vibrations and the examination of multiple mode solutions for plates in addition to his notable research professor sathyamoorthy has also developed and taught courses in the field at universities in india canada and the united states

this book contains a self consistent treatment of besov spaces for w dynamical systems based on the arveson spectrum and fourier multipliers generalizing classical results by peller spaces of besov operators are then characterized by trace class properties of the associated hankel operators lying in the w crossed product algebra these criteria allow to extend index theorems to such operator classes this in turn is of great relevance for applications in solid state physics in particular anderson localized topological insulators as well as topological semimetals the book also contains a self contained chapter on duality theory for r actions it allows to prove a bulk boundary correspondence for boundaries with irrational angles which implies the existence of flat bands of edge states in graphene like systems this book is intended for advanced students in mathematical physics and researchers alike

this book constitutes the refereed proceedings of the 6th international workshop on internet and network economics wine 2010 held in stanford usa in december 2010 the 52 revised full papers presented were carefully reviewed and selected from 95 submissions the papers are organized in 33 regular papers and 19 short papers

this textbook is devoted to combinatorics and graph theory which are cornerstones of discrete mathematics every section begins with simple model problems following their detailed analysis the reader is led through the derivation of definitions concepts and methods for solving typical problems theorems then are formulated proved and illustrated by more problems of increasing difficulty topics covered include elementary combinatorial constructions application to probability theory introduction to graphs and trees with application to hierarchical clustering algorithms more advanced counting techniques and existence theorems in combinatorial analysis the text systematically employs the basic language of set theory this approach is often useful for solving combinatorial problems especially problems where one has to identify some objects and significantly reduces the number of the students errors it is demonstrated in the text on many examples the textbook

is suitable for undergraduate and entry level graduate students of mathematics and computer science lecturers in these fields and anyone studying combinatorial methods and graphical models for solving various problems the book contains more than 700 problems and can be used as a reading and problem book for an independent study seminar or self education
