this book studies the modules arising in fourier expansions of automorphic forms namely fourier term modules on su 2 1 the smallest rank one lie group with a non abelian unipotent subgroup it considers the abelian fourier term modules connected to characters of the maximal unipotent subgroups of su 2 1 and also the non abelian modules described via theta functions a complete description of the submodule structure of all fourier term modules is given with a discussion of the consequences for fourier expansions of automorphic forms automorphic forms with exponential growth included these results can be applied to prove a completeness result for poincaré series in spaces of square integrable automorphic forms aimed at researchers and graduate students interested in automorphic forms harmonic analysis on lie groups and number theoretic topics related to poincaré series the book will also serve as a basic reference on spectral expansion with fourier jacobi coefficients only a background in lie groups and their representations is assumed

this book provides a comprehensive and self contained introduction to the study of the cauchy problem and unique continuation properties for partial differential equations aimed at graduate and advanced undergraduate students it bridges foundational concepts such as lebesgue measure theory functional analysis and partial differential equations with advanced topics like stability estimates in inverse problems and quantitative unique continuation by presenting detailed proofs and illustrative examples the text equips readers with a deeper understanding of these fundamental topics and their applications in mathematical analysis designed to serve as both a learning resource and a reference this book is particularly suited for those pursuing research in mathematical physics inverse problems or applied analysis

the field of computational sciences has seen a considerable development in mathematics engineering sciences and economic equilibrium theory researchers in this field are faced with the problem of solving a variety of equations or variational inequalities we note that in computational sciences the practice of numerical analysis for finding such solutions is essentially connected to variants of newton s method the efficient computational methods for finding the solutions of fixed point problems nonlinear equations and variational inclusions are the first goal of the present book the second goal is the applications of these methods in nonlinear problems and the connection with fixed point theory this book is intended for researchers in computational sciences and as a reference book for an advanced computational methods in nonlinear analysis we collect the recent results on the convergence analysis of numerical algorithms in both finite dimensional and infinite dimensional spaces and present several applications and connections with fixed point theory the book contains abundant and updated bibliography and provides comparison between various investigations made in recent years in the field of computational nonlinear analysis

presents the proceedings of the recently held third international conference on commutative ring theory in fez morocco details the latest developments in commutative algebra and related areas featuring 26 original research articles and six survey articles on fundamental topics of current interest examines wide ranging developments in commutative algebra together with connections to algebraic number theory and algebraic geometry

issues for feb 1965 aug 1967 include bulletin of the institute of management sciences

this is the second of two volumes of a state of the art survey article collection which originates from three commutative algebra sessions at the 2009 fall southeastern american mathematical society meeting at florida atlantic university the articles reach into diverse areas of commutative algebra and build a bridge between noetherian and non noetherian commutative algebra these volumes present current trends in two of the most active areas of commutative algebra

non noetherian rings factorization ideal theory integrality and noetherian rings the local theory graded situation and interactions with combinatorics and geometry this volume contains surveys on aspects of closure operations finiteness conditions and factorization closure operations on ideals and modules are a bridge between noetherian and nonnoetherian commutative algebra it contains a nice guide to closure operations by epstein but also contains an article on test ideals by schwede and tucker and one by enescu which discusses the action of the frobenius on finite dimensional vector spaces both of which are related to tight closure finiteness properties of rings and modules or the lack of them come up in all aspects of commutative algebra however in the study of non noetherian rings it is much easier to find a ring having a finite number of prime ideals the editors have included papers by boynton and sather wagstaff and by watkins that discuss the relationship of rings with finite krull dimension and their finite extensions finiteness properties in commutative group rings are discussed in glaz and schwarz s paper and olberding s selection presents us with constructions that produce rings whose integral closure in their field of fractions is not finitely generated the final three papers in this volume investigate factorization in a broad sense the first paper by celikbas and eubanks turner discusses the partially ordered set of prime ideals of the projective line over the integers the editors have also included a paper on zero divisor graphs by coykendall sather wagstaff sheppardson and spiroff the final paper by chapman and krause concerns non unique factorization

issue for mar 1970 dedicated to professor katuzi ono on his 60th birthday with portrait sketch of his life and list of mathematical papers
