the problem of finding minimal surfaces i e of finding the surface of least area among those bounded by a given curve was one of the first considered after the foundation of the calculus of variations and is one which received a satisfactory solution only in recent years called the problem of plateau after the blind physicist who did beautiful experiments with soap films and bubbles it has resisted the efforts of many mathematicians for more than a century it was only in the thirties that a solution was given to the problem of plateau in 3 dimensional euclidean space with the papers of douglas dj and rado r t1 2 the methods of douglas and rado were developed and extended in 3 dimensions by several authors but none of the results was shown to hold even for minimal hypersurfaces in higher dimension let alone surfaces of higher dimension and codimension it was not until thirty years later that the problem of plateau was successfully attacked in its full generality by several authors using measure theoretic methods in particular see de giorgi dg1 2 4 5 reifenberg re federer and fleming ff and almgren af1 2 federer and fleming defined a k dimensional surface in ir as a k current i e a continuous linear functional on k forms their method is treated in full detail in the splendid book of federer fh 1

the technology operation energy environmental analysis and future development of the metallurgical industries utilizing high temperature processes are covered in the book the innovations on the extraction and production of ferrous and nonferrous metals alloys and refractory and ceramic materials the heating approaches and energy management and the treatment and utilizations of the wastes and by products are the topics of special interests this book focuses on the following issues high efficiency new metallurgical process and technology fundamental research of metallurgical process alloys and materials preparation direct reduction and smelting reduction coking new energy and environment utilization of solid slag wastes and complex ores characterization of high temperature metallurgical process

this book is the tenth in a series of volumes whose aim is to provide a complete proof of the classification theorem for the finite simple groups based on a fairly short and clearly enumerated set of background results specifically this book completes our identification of the simple groups of bicharacteristic type begun in the ninth volume of the series see surv 40 9 this is a fascinating set of simple groups which have properties in common with matrix groups or more generally groups of lie type defined both over fields of characteristic 2 and over fields of characteristic 3 this set includes 11 of the celebrated 26 sporadic simple groups along with several of their large simple subgroups together with surv 40 9 this volume provides the first unified treatment of this class of simple groups

the unified small disturbance equations are numerically solved using the well known lax wendroff finite difference technique the method allows complete determination of the inviscid flow field and surface properties as long as the flow remains supersonic shock waves and other discontinuities are accounted for implicitly in the numerical method this technique was programmed for general application to the three dimensional case the validity of the method is demonstrated by calculations on cones axisymmetric bodies lifting bodies delta wings and a conical wing body combination part 1 contains the discussion of problem development and results of the study part 2 contains flow charts subroutine descriptions and a listing of the computer program

review text the book could be of interest for all who work in approximation theory and related fields it should not be overlooked by university libraries in ems newsletter 3 2009 it is useful for students interested in uniform approximation theory and it can be used as a reference book for researchers as well in l enseignement mathématique 2 2008

this reference book describes the exact solutions of the following types of mathematical equations algebraic and transcendental equations ordinary differential equations systems of ordinary differential equations first order partial differential equations linear equations and problems of mathematical physics nonlinear equations of mathematical physics systems of partial differential equations integral equations difference and functional equations ordinary functional differential equations partial functional differential equations the book delves into equations that find practical applications in a wide array of natural and engineering sciences including the theory of heat and mass transfer wave theory hydrodynamics gas dynamics combustion theory elasticity

theory general mechanics theoretical physics nonlinear optics biology chemical engineering sciences ecology and more most of these equations are of a reasonably general form and dependent on free parameters or arbitrary functions the handbook of exact solutions to mathematical equations generally has no analogs in world literature and contains a vast amount of new material the exact solutions given in the book being rigorous mathematical standards can be used as test problems to assess the accuracy and verify the adequacy of various numerical and approximate analytical methods for solving mathematical equations as well as to check and compare the effectiveness of exact analytical methods
