the langlands programme is one of the most important areas in modern pure mathematics
 the importance of this volume lies in its potential to recast many aspects of the programme
 in an entirely new context for example the morphisms in the monomial category of a locally
 p adic lie group have a distributional description due to bruhat in his thesis admissible
 representations in the programme are often treated via convolution algebras of distributions
 and representations of hecke algebras the monomial embedding introduced in this book
 elegantly fits together these two uses of distribution theory the author follows up this
 application by giving the monomial category treatment of the bernstein centre classified by
 deligne bernstein zelevinsky this book gives a new categorical setting in which to approach
 well known topics therefore the context used to explain examples is often the more
 generally accessible case of representations of finite general linear groups for example galois
 base change and epsilon factors for locally p adic lie groups are illustrated by the analogous
 shintani descent and kondo gauss sums respectively general linear groups of local fields are
 emphasized however since the philosophy of this book is essentially that of homotopy theory
 and algebraic topology it includes a short appendix showing how the buildings of bruhat tits
 sufficient for the general linear group may be generalised to the tom dieck spaces now
 known as the baum connes spaces when g is a locally p adic lie group the purpose of this
 monograph is to describe a functorial embedding of the category of admissible k
 representations of a locally profinite topological group g into the derived category of the
 additive category of the admissible k monomial module category experts in the langlands
 programme may be interested to learn that when g is a locally p adic lie group the monomial
 category is closely related to the category of topological modules over a sort of enlarged
 hecke algebra with generators corresponding to characters on compact open modulo the
 centre subgroups of g having set up this functorial embedding how the ingredients of the
 celebrated langlands programme adapt to the context of the derived monomial module

category is examined these include automorphic representations epsilon factors and L functions modular forms weil deligne representations galois base change and hecke operators
