groundwater constitutes an important component of many water resource systems supplying water for domestic use for industry and for agriculture management of a groundwater system an aquifer or a system of aquifers means making such decisions as to the total quantity of water to be withdrawn annually the location of wells for pumping and for artificial recharge and their rates and control conditions at aquifer boundaries not less important are decisions related to groundwater quality in fact the

quantity and quality problems cannot be separated in many parts of the world with the increased withdrawal of ground water often beyond permissible limits the quality of groundwater has been continuously deteriorating causing much concern to both suppliers and users in recent years in addition to general groundwater quality aspects public attention has been focused on groundwater contamination by hazardous industrial wastes by leachate from landfills by oil spills and by agricultural activities such as the use of fertilizers pesticides and herbicides and by radioactive waste in repositories located in deep geological formations to mention some of the most acute contamination sources in all these cases management means making decisions to achieve goals without violating specified constraints in order to enable the planner or the decision maker to compare alternative modes of action and to ensure that the constraints are not violated a tool is needed that will provide information about the response of the system the aquifer to various alternatives

due to inherent limitations in human sensing organs most data collected for various purposes contain uncertainties even at the rare occasions when accurate data are available the truthful predictions derived on the data tend to create chaotic consequences so to effectively process and make sense out of available data we need methods to deal with uncertainty inherently existing inside the data the intent of this monograph is to explore the fundamental theory methods and techniques of practical application of grey systems theory initiated by professor deng julong in 1982 this volume presents most of the recent advances of the theory accomplished by scholars from around the world from studying this book the reader will not only acquire an overall knowledge of this new theory but also be able to follow the most current research activities all examples presented are based on practical applications of the theory when urgent real life problems had to be addressed last but not the least this book concludes with three appendices the first one compares grey systems theory and interval analysis while revealing the fact that interval analysis is a part of grey mathematics the second appendix presents an array of different approaches of studying uncertainties and the last appendix shows how uncertainties appear using general systems approach
