logic is a foundational mathematical discipline for computer science this unique compendium provides the main ideas and techniques originating from logic it is divided into two volumes propositional logic and predicate logic the volume presents some of the most important concepts starting with a variety of logic formalisms hilbert frege systems tableaux sequents and natural deduction in both propositional and first order logic as well as transformations between these formalisms topics like circuit design resolution cutting planes hintikka sets paramodulation and program verification which do not appear frequently in logic books are discussed in detail the useful reference text has close to 800 exercises and supplements to deepen understanding of the subject it emphasizes proofs and overcomes technical difficulties by providing detailed arguments computer scientists and mathematicians will benefit from this volume

matrix singular value decomposition svd and its application to problems in signal processing is explored in this book the papers discuss algorithms and implementation architectures for computing the svd as well as a variety of applications such as systems and signal modeling and detection the publication presents a number of keynote papers highlighting recent developments in the field namely large scale svd applications isospectral matrix flows riemannian svd and consistent signal

reconstruction it also features a translation of a historical paper by eugenio beltrami containing one of the earliest published discussions of the svd with contributions sourced from internationally recognised scientists the book will be of specific interest to all researchers and students involved in the svd and signal processing field

hellman and shapiro explore the development of the idea of the continuous from the aristotelian view that a true continuum cannot be composed of points to the now standard entirely punctiform frameworks for analysis and geometry they then investigate the underlying metaphysical issues concerning the nature of space or space time

in this book for the first time a hitherto unknown general solution of the reliably known stress conditions is presented this general solution forms a reliable and new starting point to get further in stress calculations than before in this way approximately realistic solutions can be found despite a recurring problem the information deficits that are unavoidable due to the difficulty of exploring glaciers this issue is demonstrated by the example of stagnating glaciers for horizontally isotropic homogeneous tabular iceberg models even mathematically exact unambiguous solutions of all relevant conditions are presented all calculations use only elementary arithmetic operations differentiations and integrations the mathematical fundamentals are presented in detail and explained in many application examples the integral operators specific to calculations of stresses facilitate the mathematical considerations the stand alone text allows the reader to understand what is involved even without considering the formulas the author peter halfar is a theoretical physicist he also developed a model of the movement of large ice caps 1983 which is still in use today

this book presents an approximation theory for a general class of nonlinear evolution equations in banach spaces and the semigroup theory including the linear hille yosida nonlinear crandall liggett and time dependent crandall pazy theorems the implicit finite difference method of euler is shown to generate a sequence convergent to the unique integral solution of evolution equations of the maximal monotone type moreover the chernoff theory provides a sufficient condition for consistent and stable time integration of time dependent nonlinear equations the trotter kato theorem and the lie trotter type product

formula give a mathematical framework for the convergence analysis of numerical approximations of solutions to a general class of partial differential equations this book contains examples demonstrating the applicability of the generation as well as the approximation theory in addition the kobayashi oharu approach of locally quasi dissipative operators is discussed for homogeneous as well as nonhomogeneous equations applications to the delay differential equations navier stokes equation and scalar conservation equation are given
