this book systematically synthesizes research achievements in the field of fuzzy neural networks in recent years it also provides a comprehensive presentation of the developments in fuzzy neural networks with regard to theory as well as their application to system modeling and image restoration special emphasis is placed on the fundamental concepts and architecture analysis of fuzzy neural networks the book is unique in treating all kinds of fuzzy neural networks and their learning algorithms and universal approximations and employing simulation examples which are carefully designed to help the reader grasp the underlying theory this is a valuable reference for scientists and engineers working in mathematics computer science control or other fields related to information processing it can also be used as a textbook for graduate courses in applied mathematics computer science automatic control and electrical engineering

recent experimental evidence about the possibility of absolute negative temperature states in physical systems has triggered a stimulating debate about the consistency of such a concept from the point of view of statistical mechanics it is not clear whether the usual results of this field can be safely extended to negative temperature states some authors even propose fundamental modifications to the statistical mechanics formalism starting with the very definition of entropy in order to avoid the occurrence of negative values

of the temperature tout court the research presented in this thesis aims to shed some light on this controversial topic to this end a particular class of hamiltonian systems with bounded kinetic terms which can assume negative temperature is extensively studied both analytically and numerically equilibrium and out of equilibrium properties of this kind of system are investigated reinforcing the overall picture that the introduction of negative temperature does not lead to any contradiction or paradox

what makes people smarter than computers these volumes by a pioneering neurocomputing group suggest that the answer lies in the massively parallel architecture of the human mind they describe a new theory of cognition called connectionism that is challenging the idea of symbolic computation that has traditionally been at the center of debate in theoretical discussions about the mind the authors theory assumes the mind is composed of a great number of elementary units connected in a neural network mental processes are interactions between these units which excite and inhibit each other in parallel rather than sequential operations in this context knowledge can no longer be thought of as stored in localized structures instead it consists of the connections between pairs of units that are distributed throughout the network volume 1 lays the foundations of this exciting theory of parallel distributed processing while volume 2 applies it to a number of specific issues in cognitive science and neuroscience with chapters describing models of aspects of perception memory language and thought

written at a level accessible to first year graduate students this book covers five major topics in numerical analysis fast multipole methods eigenvalue problems for differential equations hierarchic modeling in mechanics wavelets from filter banks and multilevel methods the authors are renowned experts and provide up to date overviews complete with extensive bibliographies along with new and previously unpublished material both students and experienced researchers will find this volume an ideal starting point for pursuing these important topics or applying the methods to their own research the book contains proceedings from the seventh epsrc numerical analysis summer school held in 1996

this volume provides a general overview on the state of the art and future developments in automation and control the application of systems and control in all areas is covered from the social and cultural effects of control to control in mineral and metal processing this volume will be an invaluable source of information to all those interested in the areas of automation and control

welcome to the 2008europeanconference oncomputer vision these proce ings are the result of a great deal of hard work by many people to produce them a total of 871 papers were reviewed forty were selected for oral pres tation and 203 were selected for poster presentation yielding acceptance rates of 4 6 for oral 23 3 for poster and 27 9 in total weappliedthreeprinciples first sincewehadastronggroupofareachairs the nal decisions to accept or reject a paper rested with the area chair who wouldbeinformedbyreviewsandcouldactonlyinconsensuswithanotherarea chair second we felt that authors were entitled to a summary that explained how the area chair reached a decision for a paper third we were very careful to avoid con icts of interest each paper was assigned to an area chair by the program chairs and each area chair received a pool of about 25 papers the area chairs then identi ed and rankedappropriatereviewersfor eachpaper in their pool and a constrained optimization allocated three reviewers to each paper we are very proud that every paper received at least three reviews at this point authors were able to respond to reviews the area chairs then needed to reach a decision we used a series of procedures to ensure careful review and to avoid con icts of interest programchairs

did not submit papers the area chairs were divided into three groups so that no area chair in the group was in conflict with any paper assigned to any area chair in the group
