lie superalgebras are a natural generalization of lie algebras having applications in geometry number theory gauge field theory and string theory this book develops the theory of lie superalgebras their enveloping algebras and their representations the book begins with five chapters on the basic properties of lie superalgebras including explicit constructions for all the classical simple lie superalgebras borel subalgebras which are more subtle in this setting are studied and described contragredient lie superalgebras are introduced allowing a unified approach to several results in particular to the existence of an invariant bilinear form on mathfrak g the enveloping algebra of a finite dimensional lie superalgebra is studied as an extension of the enveloping algebra of the even part of the superalgebra by developing general methods for studying such extensions important information on the algebraic structure is obtained particularly with regard to primitive

ideals fundamental results such as the poincare birkhoff witt theorem are established representations of lie superalgebras provide valuable tools for understanding the algebras themselves as well as being of primary interest in applications to other fields two important classes of representations are the verma modules and the finite dimensional representations the fundamental results here include the jantzen filtration the harish chandra homomorphism the sapovalov determinant supersymmetric polynomials and schur weyl duality using these tools the center can be explicitly described in the general linear and orthosymplectic cases in an effort to make the presentation as self contained as possible some background material is included on lie theory ring theory hopf algebras and combinatorics
