in the last few decades the theory of ordinary differential equations has grown rapidly under the action of forces which have been working both from within and without

from within as a development and deepening of the concepts and of the topological and analytical methods brought about by Lyapunov, Poincaré, Bendixson and a few others at the turn of the century from without in the wake of the technological development particularly in communications, servomechanisms, automatic controls and electronics. The early research of the authors just mentioned lay in challenging problems of astronomy but the line of thought thus produced found the most impressive applications in the new fields. The body of research now accumulated is overwhelming and many books and reports have appeared on one or another of the multiple aspects of the new line of research which some authors call qualitative theory of differential equations. The purpose of the present volume is to present many of the viewpoints and questions in a readable short report for which completeness is not claimed. The bibliographical notes in each section are intended to be a guide to more detailed expositions and to the original papers. Some traditional topics such as the Sturm comparison theory have been omitted also excluded were all those papers dealing with special differential equations motivated by and intended for the applications.

This volume of the EMS contains three articles on linear overdetermined systems of partial differential equations, dissipative Schrödinger operators and index theorems. Each article presents a comprehensive survey of its subject discussing fundamental results such as the construction of compatibility operators and complexes for elliptic, parabolic and hyperbolic coercive problems, the method of functional models and the Atiyah-Singer index theorem and its generalisations. Both classical and recent results are explained in detail and illustrated by means of examples.
