developments in geotechnical engineering volume 7 limit analysis and soil plasticity covers the theory and applications of limit analysis as applied to soil mechanics organized into 12 chapters the book presents an introduction to the modern development of theory of soil plasticity and includes rock like material the first four chapters of the book describe the technique of limit analysis beginning with the historical review of the subject and the assumptions on which it is based and then covering various aspects of available techniques of limit analysis the subsequent chapters deal with the applications of limit analysis to what may be termed classical soil mechanics problems that include bearing capacity of footings lateral earth pressure problems and stability of slopes in many cases comparisons of limit analysis solution and conventional limit equilibrium and slip like solutions are also presented other chapters deal with the advances in bearing capacity

problem of concrete blocks or rock and present theoretical and experimental results of various concrete bearing problems the concluding chapter examines elastic plastic soil and elastic plastic fracture models for concrete materials this book is an ideal resource text to geotechnical engineers and soil mechanics researchers

common feature is that these evolution problems can be formulated as asymptotically small perturbations of certain dynamical systems with better known behaviour now it usually happens that the perturbation is small in a very weak sense hence the difficulty or impossibility of applying more classical techniques though the method originated with the analysis of critical behaviour for evolution pdes in its abstract formulation it deals with a nonautonomous abstract differential equation  $u' = A(t)u + c(t)$  where  $u$  has values in a Banach space like an  $L^p$  space  $A$  is an autonomous time independent operator and  $c$  is an asymptotically small perturbation so that  $c(t) \rightarrow 0$  as  $t \rightarrow \infty$  along orbits  $u(t)$  of the evolution in a sense to be made precise which in practice can be quite weak we work in a situation in which the autonomous limit differential equation  $u' = Au$  has a well known asymptotic behaviour and we want to prove that for large times the orbits of the original evolution problem converge to a certain class of limits of the autonomous equation more precisely we want to prove that the orbits of nde are attracted by a certain limit set  $S$  of  $u'$  which may consist of equilibria of the autonomous equation or it can be a more complicated object

the heat equation is one of the three classical linear partial differential equations of second order that form the basis of any elementary introduction to the area of pdes and only recently has it come to be fairly well understood in this monograph aimed at research students and academics in mathematics and engineering as well as engineering specialists professor vazquez provides a systematic and comprehensive presentation of the mathematical theory of the nonlinear heat equation usually called the porous medium equation pme this equation appears in a number of physical applications such as to describe processes involving fluid flow heat transfer or diffusion other applications have been proposed in mathematical biology lubrication boundary layer theory and other fields each chapter contains a detailed introduction and is supplied with a section of notes providing comments historical notes or recommended reading and exercises for the reader

food is a contentious and emotive issue subject to critiques from multiple perspectives alternative food movements including the different articulations of local food miles seasonality food justice food knowledge and food sovereignty consistently invoke themes around autonomy sufficiency cooperation mutual aid freedom and responsibility in this stimulating and provocative book the authors link these issues to utopias and intentional communities using a food utopias framework presented in the introduction they examine food stories in three interrelated and complementary ways utopias as critique of existing systems utopias as engagement with experimentation of the novel the forgotten and the hopeful in the future of the food system and utopias as process that recognizes the time and difficulty inherent in changing the status quo the chapters address theoretical aspects of food utopias and also present case studies from a range of contexts and regions including argentina italy switzerland and usa these focus on key issues in contemporary food studies including equity locality the sacred citizenship community and food sovereignty food utopias offers ways forward to imagine a creative and convivial food system
