annotation this book presents a series of review chapters on the various aspects of primate kinship and behavior the relatively new molecular data allow one to assess directly degrees of genetic relatedness and kinship relations between individuals a considerable body of data on intergroup variation based on experimental studies in both free ranging and captive groups has accumulated this allows a full and satisfying reconsideration of this broad area of research

the book is an all in one compilation of 36 popular classroom demonstrations published since 1993 in the favorite demonstration column of nsta s journal of college science teaching the collection begins with a chapter on safety the rules of research from

these chapters emphasize conveying scientific principles while making them memorable

knowing the safety factor for limit states such as plastic collapse low cycle fatigue or ratcheting is always a major design consideration for civil and mechanical engineering structures that are subjected to loads direct methods of limit or shakedown analysis that proceed to directly find the limit states offer a better alternative than exact time stepping calculations as on one hand an exact loading history is scarcely known and on the other they are much less time consuming this book presents the state of the art on various topics concerning these methods such as theoretical advances in limit and shakedown analysis the development of relevant algorithms and computational procedures sophisticated modeling of inelastic material behavior like hardening non associated flow rules material damage and fatigue contact and friction homogenization and composites

the experiments in this manual are designed in a discovery format and the majority require only small quantities of reagents

the papers presented in high temperature structural design esis publication 12 are the reviewed and revised versions of the lectures presented at the eponymous venice conference this conference was deliberately tailored to include all industrial areas where high temperature structural integrity problems are encountered and an effort was made to cover several different aspects of structural design including material modelling and experience feedback and to achieve a cross fertilization of ideas between different application areas the twenty two papers are grouped together under four headings namely design practice stress and strain analysis methods damage evaluation and finally in service experience representing the current state of the art in high temperature structural design this volume can be wholeheartedly recommended not only to engineering designers but also to physicists and to materials scientists concerned with the integrity of structures at high temperatures in all areas of industry

statistics for engineers and scientists stands out for its crystal clear presentation of applied statistics the book takes a practical approach to methods of statistical modeling and data analysis that are most often used in scientific work this edition features a unique approach highlighted by an engaging writing style that explains difficult concepts clearly along with the use of contemporary real world data sets to help motivate students and show direct connections to industry and research while focusing on practical applications of statistics the text makes extensive use of examples to motivate fundamental concepts and to develop intuition mcgraw hill s connect is also available as an optional add on item connect is the only integrated learning system that empowers students by continuously adapting to deliver precisely what they need when they need it how they need it so that class time is more effective connect allows the professor to assign homework quizzes and tests easily and automatically grades and records the scores of the student s work problems are randomized to prevent sharing of answers an may also have a multi step solution which helps move the students learning along if they experience difficulty
